

Beyond Basics with **LingoRank**: Elevating French Text Analysis using Machine Learning

Data Science and Machine Learning

Detecting the difficulty level of French texts

Team: UNIL_Zurich

Matteo Frison Takaaki Kishida

December 20, 2023

Our Project Goals

Enhancing Language Learning

- LingoRank is committed to revolutionizing language learning by accurately assessing the difficulty level of French texts for English speakers.

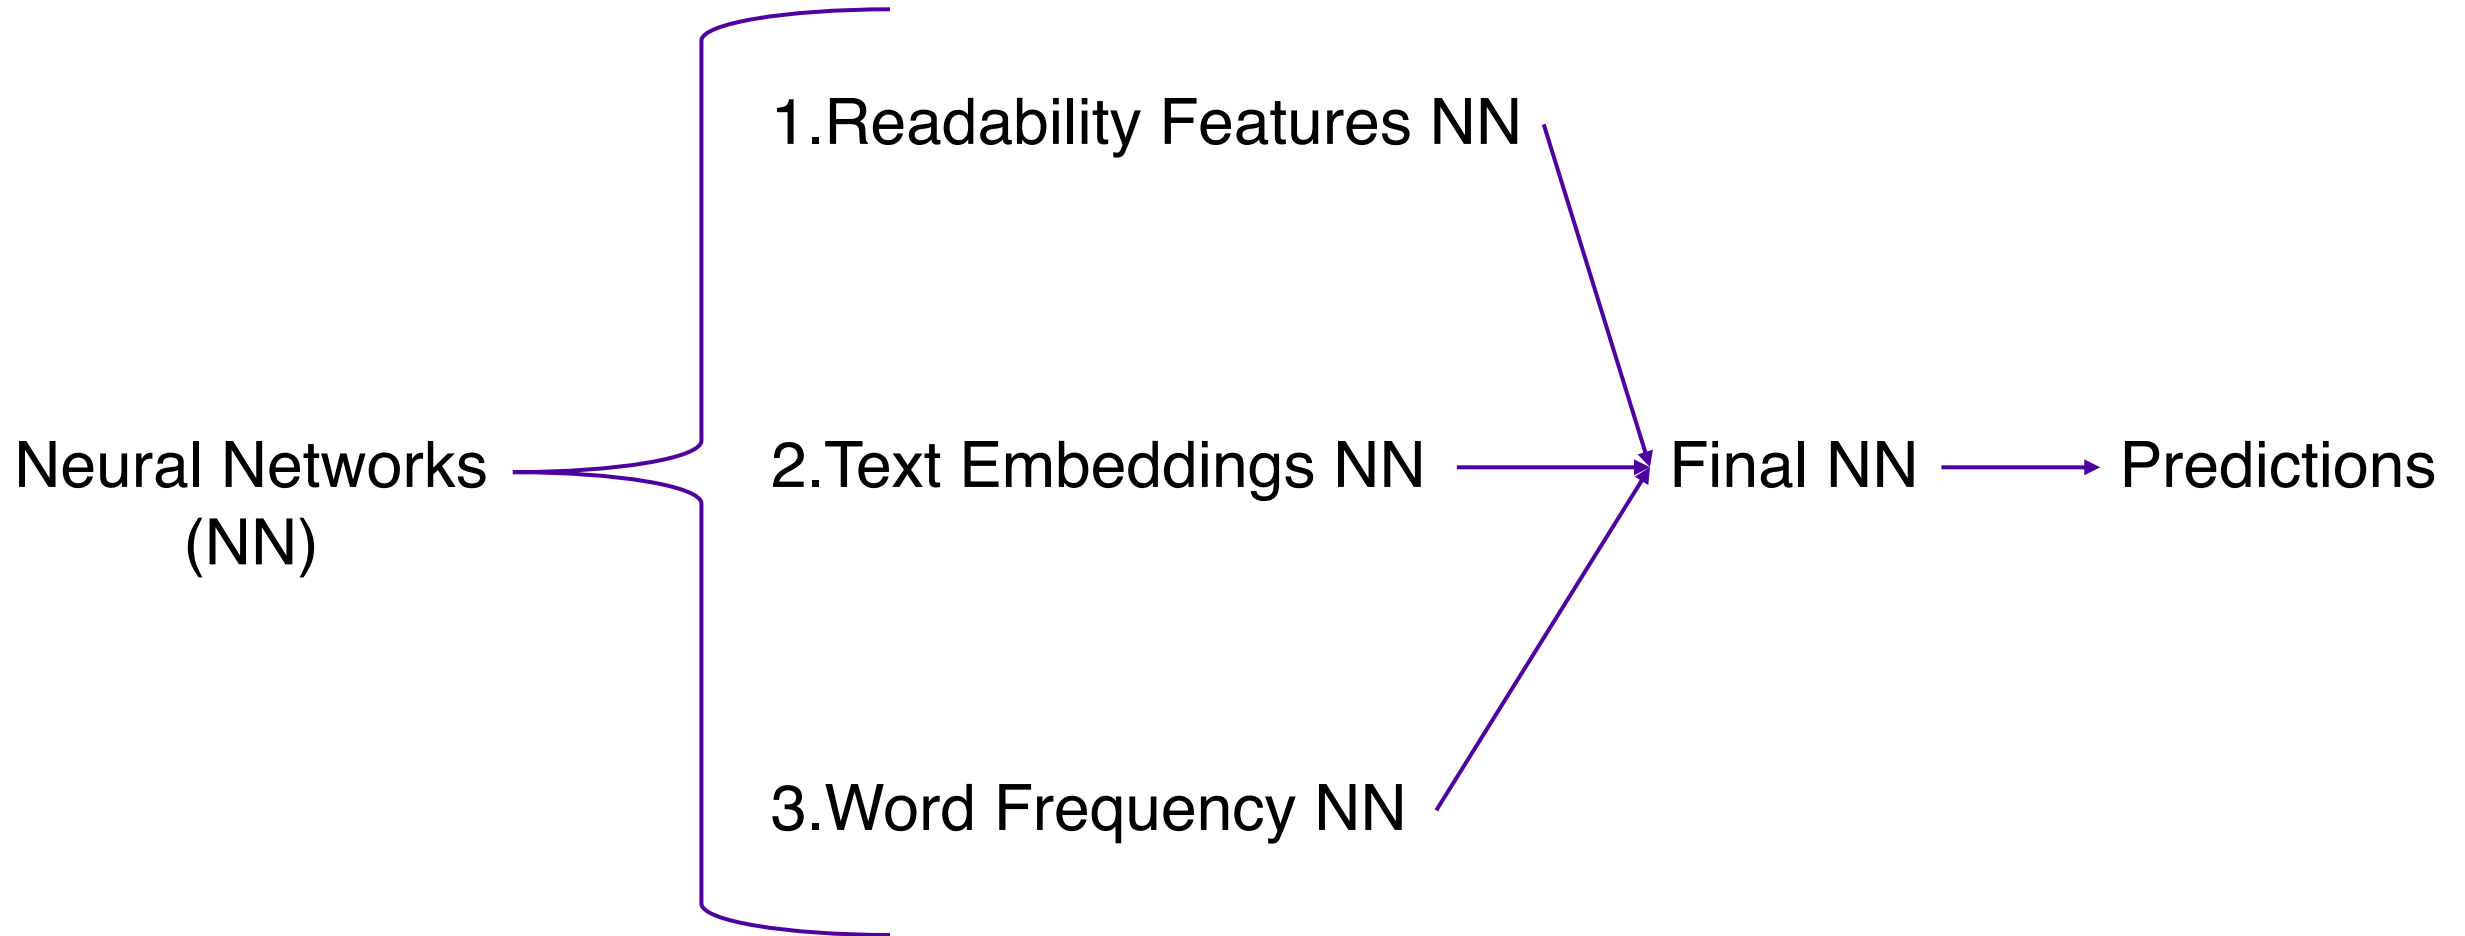

Personalized Learning

- Our primary goal is to enhance the learning experience by matching readers with texts that align with their current proficiency level.
- This approach ensures that learners are engaged with material that is challenging yet appropriate for their skill level.

Data Overview

- Source
 - The dataset consists of French texts of varying complexity
- Labels
 - Texts are labeled with language proficiency levels, ranging from A1 (beginner) to C2 (advanced).
- Volume
 - Training Data: 4,800 entries, 3 features each (id, sentence, difficulty).
 - Unlabeled Test Data: 1,200 entries, 2 features each (id, sentence).

Methodology Overview

Preprocessing Steps

1. Data Preparation

- **NN Readability feature**
 - (X) Avg sentence length, Avg word length, Avg syllable count per word, Nb of word with 1 to 3 syllables, Nb of words with 4 syllables, Nb of long (>10) words, Nb of {NOUN, AJD, ADV, ADP, PRON, DET, VERB} using spaCy “fr_dep_news_trf”
 - (y) Onehot Encoding
- **NN CamemBert**
 - (X) Tokenized sentences with CamembertTokenizer. Max length = 250.
 - (y) Label Encoding
- **NN Word Frequency**
 - (X) Tokenized sentences spaCy “fr_dep_news_trf” (with stopwords!). TfidfVectorizer with ngram_range=(1, 1).
 - (y) Onehot Encoding
- **Final NN**
 - (X) Predictions from the 3 NN above.
 - (y) Onehot Encoding

2. Data Splitting

- Initially, split into training and validation sets with a 70-30 ratio for the first 3 NN.
- Then, train the final model with a 80-20 ratio.
- Re-train the first 3 model with a 99.9-0.01 ratio.

Core Model Architecture and Training (1/4)

Model Architecture

- **Readability Feature:** Analyzes linguistic features such as sentence length and syllable count using `pyphen` and `spaCy`.
- Input Layer → BatchNormalization Layer → Dense Layer (256 neurons, relu activation, L2) → Dropout Layer (0.1) → Dense Layer (128 neurons, relu activation, L2) → Dropout Layer (0.1) → Dense Layer (6 neurons, softmax activation, L2)

Training Process

- **Optimization:** Applies `AdamW` optimizer and a linear learning rate scheduler. $Lr = 3e-5$
- **Training Details:** Conducts training over 100 epochs. Batch size = 16
- **Validation:** Evaluates model accuracy on a separate validation set.

Core Model Architecture and Training (2/4)

Model Architecture

- **CamemBERT Model:** Uses `CamembertForSequenceClassification` which is a CamemBERT Model transformer with a sequence classification/regression head on top. Model trained on 138GB of French text
- From **CamemBERT: a Tasty French Language Model:**
- “Similar to RoBERTa and BERT, CamemBERT is a multi-layer bidirectional Trans-former”
- “CamemBERT uses the original architectures of BERTBASE (12 layers, 768 hidden dimensions, 12 attention heads, 110M parameters)”

Training Process

- **Optimization:** Applies AdamW optimizer and a linear learning rate scheduler. $Lr = 3e-5$
- **Training Details:** Conducts training over 4 epochs. Batch size = 16
- **Validation:** Evaluates model accuracy on a separate validation set.

Core Model Architecture and Training (3/4)

Model Architecture

- **Word Frequency NN:** TF-IDF to use the importance of a word as a text difficulty measure.
- Input Layer → Batch Normalization → Layer Dropout Layer (0.1) → Dense Layer (6 neurons, softmax activation, L2)

Training Process

- **Optimization:** Applies AdamW optimizer and a linear learning rate scheduler. $Lr = 3e-5$
- **Training Details:** Conducts training over 60 epochs. Batch size = 16
- **Validation:** Evaluates model accuracy on a separate validation set.

Core Model Architecture and Training (4/4)

Model Architecture

- **Final Model:**
- Input Layer → Batch Normalization Layer → Dropout Layer (0.1) → Dense Layer (128 neurons, relu activation, L2) → Dropout Layer (0.1) → Dense Layer (6 neurons, softmax activation, L2)

Training Process

- **Optimization:** Applies AdamW optimizer and a linear learning rate scheduler. $Lr = 3e-5$
- **Training Details:** Conducts training over 100 epochs. Batch size = 16
- **Validation:** Evaluates model accuracy on a separate validation set.

Model Evaluation and Final Prediction

Evaluation and Prediction

- **Ensemble Approach:** Combines outputs from BERT, TF-IDF, and feature-based models for robust predictions.
- **Final Classifier Model:** Uses a concatenated output to predict difficulty levels with a custom TensorFlow model.

Output and Deployment

- **Performance Visualization:** Employs confusion matrices to showcase model accuracy.
- **Result Exporting:** Predicts difficulty levels for new sentences.

Results (1/4)

- **Readability features NN**

- Our model achieved an accuracy of 41.1%
- Strongest at identifying beginner, particular A1. Not too bad with C1
- Most confusion with other levels.

Confusion Matrix

	0	1	2	3	4	5
Actual 0	192	30	14	9	1	0
Actual 1	107	70	39	11	2	6
Actual 2	49	54	75	24	23	18
Actual 3	23	7	18	78	69	42
Actual 4	13	6	24	45	107	38
Actual 5	20	10	22	47	77	70
Predicted	0	1	2	3	4	5

Results (2/4)

- **CamemBert NN**
- Our model achieved an accuracy of 55%
- Strongest at identifying beginner and advanced levels. Quite precise, very few outliers.
- Most confusion with C1 and A2. Most confusion between adjacent levels.

Confusion Matrix

	0	1	2	3	4	5
Actual 0	199	36	11	0	0	0
Actual 1	69	104	58	4	0	0
Actual 2	22	65	138	15	2	1
Actual 3	1	2	51	132	40	11
Actual 4	2	1	10	96	86	38
Actual 5	0	0	11	41	60	134
	0	1	2	3	4	5
Predicted						

Results (3/4)

- **Word Frequency NN**
- Our model achieved an accuracy of 45.7%
- Strongest at identifying beginner and advanced levels.
- Most confusion between middle levels, such as B1 and B2. A lot of outliers.

Confusion Matrix

	0	1	2	3	4	5
0	153	52	28	8	3	2
1	63	101	39	12	11	9
2	34	57	78	32	20	22
3	15	10	17	99	57	39
4	16	7	13	43	108	46
5	17	8	10	38	53	120
Actual \ Predicted	0	1	2	3	4	5

Results (4/4)

- **Final NN**
- Our model achieved an accuracy of 54.1%
- Strongest at identifying beginner and advanced levels. Very few outliers
- Most confusion between middle levels such as B1 and B2.

Confusion Matrix

	0	1	2	3	4	5
0	36	12	7	0	0	0
1	9	27	12	0	0	0
2	4	11	20	8	1	0
3	0	1	6	17	10	5
4	1	1	2	12	24	14
5	0	0	3	4	9	32
	0	1	2	3	4	5

Actual

Predicted

Conclusion: Next Steps in Model Evolution

- Enhanced Differentiation of Intermediate Levels
 - Improve distinction between intermediate levels with advanced feature engineering.
- Real-World Testing
 - Deploy in a beta setting for user feedback and model refinement.

Thank you for listening!
